1 Introduction

Although a number of papers were reported for the chemical or instrumental analysis of inorganic elements for the geochemical samples (Sun and Xie, 2014; Sun et al., 2014; Rao et al., 2004). However, the analytical methods for acidolysis hydrocarbons in geochemical exploration sample were scarce (He et al., 2011; Chen et al., 2012; Standard, 2003).

In this paper, a method of acidolysis hydrocarbons analysis in oil/gas geochemical sample by Autosampler-GC-FID has been developed. The acidolysis hydrocarbons equipment has been improved, and the method is suitable for batch processing to improve the analytical efficiency. A method was adopted under the condition of vacuum at 40 °C water bath for the acidolysis hydrocarbons pretreatment, and the acidolysis reaction time is 5 ~ 10 min for about 20 g sample. The detecting instrument was AOC5000 Autosampler-GC-2010 gas chromatography with HP-PLOT Al₂O₃/KCl capillary column. The typical gas chromatogram peaks for acidolysis hydrocarbons in the gas hydrate area sample shows in Figure 1. The optimization of main analytical conditions and quality assessment and control were discussed in details. Detection program can be completed within 6min, and autosampler vial with 98 injection place, greatly improving the efficiency of the analysis. The detection limits of the method for the acidolysis hydrocarbons is 0.055 ~ 0.209 μL/kg, and the precision of the method is 0.85% ~ 1.11% (RSD). The relative deviation of two independent test results for 105 samples is between 0.01% and 16.42% (methane). The method provides the advantages of high-efficiency and reliability, and it can meet the requirement of determination of acidolysis hydrocarbons in oil/ and gas geochemical sample. The

method has been applied to a great quantity real sample analysis with the satisfactory results for geochemical exploration of gas hydrates.

Key words: gas-chromatography; acidolysis hydrocarbons; natural gas hydrate; Geochemical sample
