

On Some Problems Remained for the Study of Mineral Deposits
—— Reply to Prof. Huang Dianhao

MAO Jingwen

Institute of Mineral Resources, Chines Academy of Geological Sciences, Beijing, 100037

Abstract: The paper discusses some important tectonic events and related mineralizations through geological history with uniformitarianism, and promotes better to understand the ore deposit types from Russian styles we used before to American—European style we use now. The paper also describes that the situation of papers’ citing in past 30 ~40 years in China have changed a lot from quite a few references cited in the papers before 2000 and are gradually getting normal after 2000. The earlier papers cited in recent papers used some data of even earlier papers but did not them, which causes much dispute of intellectual property right. Some Chinese peoples are not use to have "Created in China" very well since following western colleagues for a lifetime. However, they have to face the fact that China is rising and "created in China" will be more and more.

Keywords: ore deposit types; papers’ citing; progress of science and technology
